

Project Title: Hotel Reception System

Description: A management solution designed to streamline the booking process and guest experience through efficient reservation and tracking workflows.

Key Features:

Reservation Management: Capabilities to create, modify, and cancel guest bookings.

Real-time Tracking: Live updates for room availability and occupancy status.

Automated Workflows: Integrated guest check-in and check-out processes.

Secure Access: Employee-specific authentication for system security.

Technical Documentation:

System Architecture: Component-based architecture featuring dedicated modules for Reservations, Guest Info, and Authentication.

UI/UX Requirements: Defined functional requirements including form-based guest entry and interactive room lists.

Testing: Comprehensive test cases for core modules including Login, Guest Management, and Checkout.

Project Planning: The development was structured into a 10-task lifecycle, including dedicated phases for Requirements Analysis, System Design, and User Acceptance Testing (UAT).
